Digital Receiver With Interference Suppression for Microwave Radiometry

PIs: Joel T. Johnson (Ohio State) and Steven W. Ellingson (Virginia Tech)

Objectives

- Future sea salinity and soil moisture sensing missions use L-Band microwave radiometry
- RF interference is a major problem and limits useable bandwidth to 20 MHz.
- An interference suppressing radiometer could reduce RFI effects on these systems and allow operation in a larger bandwidth for more accurate moisture/salinity retrievals
- Project developed a radiometer digital backend including real-time removal of time and/or frequency localized RFI sources

200 MSPS 10 bit ADC’s

Implemented in Altera FPGA’s

Real-time "pulse blanking" algorithm

1K FFT = high spectral resolution RFI removal

Digital filtering/ pulse blanking

1K FFT Spectral processing/ integration

Accomplishments

- Receiver prototypes developed; sample 100 MHz bandwidth with real-time pulse blanking and 1K FFT
- Demonstrated at Arecibo radio observatory and in local observations of water pool and sky targets
- Results qualitatively show significant RFI mitigation and advantages of high spectral resolution
- RFI surveys at L-band (including airborne measurements) completed under project support
- System developed can be applied in other RF bands: NPOESS sponsored project using this system at C-band in progress: results to influence CMIS design
- Proposal to utilize these technologies at L-band in the HYDROS program under evaluation
